

## Measuring Your Yacht

### *List of ORC measured superyachts tops 50*

A welcome change in superyacht racing in recent years has been a growing sense of confidence from owners and sailors that the superyacht rating rule of choice (ORCs) has enhanced fair racing. A fully transparent VPP has played a meaningful role in the popularity of the rule, which debuted 4 short years ago. But so too has the fact that measured data is steadily replacing declared data fleet wide. As of December 2017, 50 superyachts were fully measured with another 18 partially measured or scheduled early in 2018 .

As more yachts get measured, it has been substantiated that some of the data declared by teams has not accurately reflected the 'as raced' condition of their yacht. Both the SYRA and ORC have been encouraging racing superyachts to consider getting measured during the next yard period when they are scheduled to haul out. In addition to playing a role in fair racing, programs will be able to accurately quantify their yachts' 'as raced' displacement and stability.

Participating programs have been reminded that the ORCs VPP will again feature a rating adjustment for those yachts that are unmeasured (approximately 1% across all wind ranges in 2018). This transparent adjustment will be reflected on the certificates. It is the intent of the rating authority to reassess the rating adjustment for the following year as they learn more about the realities of measured versus declared data. Regatta Organizers and the ORC encourage those programs planning to race in the future to make arrangements to measure the next time their yachts are scheduled to be hauled.

There are two steps to measuring – the out of water hull scanning to capture offset files and then the flotation and inclining procedure while in the water. The Rule Authority is more than willing to explain the process to Captains who would be measuring for the first time. Please contact the ORC or refer to the applicable section of the ORC website:
